This study focuses on UX strategy, transactional security, and regulatory compliance.

COMPANY TC (TradersClub)	MY ROLE Product Designer	FOCUS B2B, Automation & DS
PLATFORM Web (SaaS)	DELIVERABLE Factsheet Generator	IMPACT Revenue Generation

01 · CONTEXT

Creating a New Business Unit

TC is widely known for its strength in the B2C market, educating and connecting individual investors.
My mission upon joining the company was a **"blank page"** challenge: to found the B2B (Business-to-Business) business unit from scratch.

With no prior knowledge of the financial sector, I first spent time learning about investments and then dived into an intensive B2B learning process to understand how TC could monetize and add value for financial institutions and research houses.

02 · DISCOVERY

Identifying the "Factsheets" Bottleneck

Through a **deep discovery** and **research sessions with heads of asset managers and investment funds**, I identified a critical operational pain: the creation of **Monthly Fund Factsheets.**

THE PROBLEM AND THE COST

The Problem: In Brazil, funds are required to issue monthly documents (PDFs) detailing movements, profitability, and strategies.

The Cost of Inefficiency: Management firms took, on average, two weeks per month to consolidate data and design these documents, often needing to hire dedicated teams just for this manual task.

After mapping the complete journey of the management firms, we used a **prioritization matrix** to focus on the Factsheets problem. We identified that this was the largest operational bottleneck, and automation would bring the most immediate **ROI (Return on Investment)** for the new B2B vertical.

03 · DESIGN SYSTEM STRATEGY

Breaking the Mold

One of the most critical points was the decision **not to use TC\'s B2C Design System**. While the general public product was migrating towards a rounded, modern aesthetic (inspired by Material Design), my research revealed a completely opposite B2B user profile, which is why we proceeded with the use of **IBM\'s Carbon Design System**, which caused the users\' learning curve to drop drastically.

45+ AUDIENCE ACCUSTOMED TO IBM/ORACLE

Persona: Men, 45+ years old, accustomed to dense interfaces like Excel, and IBM and Oracle tools.

The Decision: We opted to implement the **Carbon Design System (IBM)**. A more "square", dark, and technical interface that prioritizes information density and conveys the solidity required for the corporate financial environment. Choosing Carbon was not just aesthetic, but to reduce the cognitive load of users accustomed to robust infrastructure software.

04 · THE SOLUTION

Automation and Flexibility

Before proceeding to development, we conducted **usability testing sessions** with high-fidelity prototypes. The choice of the Carbon Design System was validated in practice: 45+ users demonstrated a **near-zero learning curve**, as the interface reflected the density and seriousness of the financial terminals they already used daily.

I designed an intelligent generator where the system consumed the data and generated charts automatically. The only human effort required was the manager\'s subjective analysis.

⚙️
Data Automation
The system consumed fund data and generated charts automatically.

🎨
Freedom and Customization
The builder allowed each client to personalize the PDF with their own visual identity, even under a solid base (Carbon).

🧠
Strategic Intervention
The only human effort needed was the manager's subjective analysis.

05 · IMPACT

Million-Dollar Results

The adoption of Carbon allowed for much faster technical development focused on data logic, with massive results for the new B2B unit.

⏱️
Reduction in production time from 2 weeks to 15-20 minutes.

💰
Average revenue of R$ 2 million/month in the 1st month of the MVP.

🚀
Fast technical development thanks to the Carbon Design System.
